2011-06-01 Date of arrival: Test ID: PRH22\_02 2011-06-01 Date(s) of test:

Burgrieden, 2012-02-15

Released by:

Principal engineer - Christian Vogelmann

Test laboratory: EMCE GmbH

Ingenieurbüro für EMV-Prüfungen und Schaltungsentwicklung

Untere Wiesen 1 / 88483 Burgrieden / Germany

DAkkS-Registration No.: D-PL-12122-01-01 CAB-Registration No.: BnetzA-CAB-02/21-01/1

FCC-Registration No.: 90568 – old FCC-Registration No.: 219415 – new

Additional test site: University of Applied Sciences

Eberhard-Finckh-Str. 11 / 89075 Ulm / Germany The susceptibility test according EN 61000-4-3 performed in the EMC-testing laboratory of the

University of Applied Sciences

Responsible inspector: Peter Hauser

**EMCE GmbH** 

Ingenieurbüro für EMV-Prüfungen und Schaltungsentwicklung

Contact person: Mr. Manfred Weinzierl

EUT-

**Description:** The iP1 SmartSystem consists of a sporting gun enabled with a

RF ID signal generated by a dedicated watch and an USB stick provided for data transfer between sportive gun and a PC

system.

Voltage supply: Internal

Frequency list: 5.3kHz / 32.768kHz / 4MHz / 916.35MHz

**Temperature range:** n/a

Size: Watch (LxWxH) / mm - approx. 57x40x13mm

All used test equipment are checked resp. calibrated periodically.

Test equipment was checked and complied to the requirements

Test report 2012-01-12

#### Test / Measurement uncertainty

The measurement uncertainty in the test met the guideline of CISPR16-4-2 or better.

Measurement uncertainty of the radiated emission with an extended coverage factor of k=2:

Frequency Measurement uncertainty

9kHz – 30MHz on request 30MHz - 300MHz 4.4dB 300MHz – 1GHz 3.4dB 1GHz – 18GHz on request

## 1.1.2.2 <u>Test – intentional radiation</u>

#### Test - / Measurement procedure

Measurements are made with a receiver according CISPR guidelines. Frequencies equal or below 1000MHz are tested with quasi-peak detector and related bandwidths. Average detector is used for frequencies above 1000MHz and a related bandwidth of 1MHz. The limit on peak RF emissions is 20dB above the maximum permitted average emission limit. Emissions are tested up to the tenth harmonic of the highest fundamental frequency of the intentional radiator.

## Test result Limit for radiated fundamental: kept not kept Limit for radiated harmonics: kept not kept Limits for radiated frequencies outside the frequency bands others than harmonics: kept not kept kept according **Section 15.209** not kept according Section 15.209 Remarks: Harmonics below the limit with a margin > 20dB to the limit are generally not listed. For frequencies outside the frequency bands see radiated emissions – general requirements.

#### Test - / Measurement procedure

Measurements are made with a receiver according CISPR guidelines. Frequencies equal or below 1000MHz are tested with guasi-peak detector and related bandwidths. Except for the frequency bands 9-90kHz and 110-490kHz an average detector is employed. Average detector is also used for frequencies above 1000MHz with a related bandwidth of 1MHz. At a pre-test in the shielded room the required frequency range is scanned in an automatically operation with peak detector. If the emanation is closer than 6dB to the limits or more, the receiver will retest the exact value with quasipeak or average detector. The determined frequencies are re-tested in an OATS measurement.

## Test result Limits for radiated disturbances: Remarks: Radio disturbances below the limit line with a margin > 10dB to the limit are generally not listed. Protocol scope Readings - Antenna horizontal polarized. Diagram - Antenna horizontal polarized. Readings - Antenna vertical polarized. Diagram - Antenna vertical polarized. Precompliance measurement(s).
